DATE MAILED: 01/07/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

Application No.

09/747,731

Applicant(s)

YAMAZAKI ET AL.

Examiner

William P. Fletcher III

Art Unit

1762

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 27 October 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 20-22, 37-40, 43-45, 48, 49 and 53-68 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 20-22, 37-40, 43-45, 48, 49 and 53-68 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 19 May 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
- 1) ☒ Certified copies of the priority documents have been received.
  - 2) ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - 3) ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 9/7/2004 has been entered.
2. To clarify the record at this point in the prosecution, claims 20-22, 37-40, 43-45, 48, 49, and 53-68 are pending.

### ***Response to Arguments***

3. Applicant's arguments filed 9/7/2004 have been fully considered but they are not persuasive. These arguments were addressed fully at pages 3-4 of the advisory action mailed 10/8/2004 and are incorporated herein again. New claims 63-68 are addressed in the grounds of rejection below.

### ***Claim Rejections - 35 USC § 103***

4. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later

Art Unit: 1762

invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

**6. Claims 20 – 22, 44, 45, 48, and 63 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A) in view of Grothe et al. (US 3,391,490 A) and Monk (US 4,187,801 A).**

With respect to claims 20 and 48, Arai teaches a method of manufacturing a display device in a cluster tool [abstract; c. 2, ll. 31 – 35; and c. 3, ll. 10 – 15]. Each processing chamber, of which there are at least two, has an evaporation source for the deposition of a material, which may be an organic electroluminescence material, on the substrate [c. 3, l. 66 – c. 5, l. 55]. As the substrate is transferred between chambers, layers of different EL materials are successively applied to produce the display device [c. 4, ll. 34 – 51 and c. 9, ll. 1 – 20]. Arai does not place any limitations on the layer deposition processes carried-out in the chambers.

Arai does not teach that the first and second evaporation sources have a first direction longer than a second direction or that the relative positions of the sources and the substrates are repeatedly moved during deposition so that a same portion of the substrate is coated with the organic EL material at least twice.

Grothe teaches that, when coating a substrate by vapor deposition, an evaporation source elongated in one dimension results in enhanced vapor density and deposition uniformity over the entire width of the substrate [c. 5, ll. 40 – 50 and 60 – 63]. It is the examiner's position that the source of Grothe reads on applicant's source.

It would have been obvious to one of ordinary skill in the art to modify the process of Arai so as to utilize, as the evaporation source, the evaporation source of Grothe. One of

Art Unit: 1762

ordinary skill in the art would have been motivated to do so by the desire and expectation of achieving enhanced vapor density and deposition uniformity, as taught by Grothe.

Monk teaches that, in a process where a substrate is coated from an evaporation source, it is known to move the substrate and the evaporation source relative to each other [c. 1, ll. 9 – 21]. Doing so yields a uniform coating [c. 1, l. 15].

It would have been obvious to one of ordinary skill in the art to further modify the process of Arai so as to move the substrate and the evaporation sources relative to each other, as taught by Monk. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of yielding a uniform coating.

Lastly, it is well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

With respect to claim 21, none of the cited references teach cleaning the inside of the deposition chambers. It is the examiner's position, however, that cleaning the inside of a deposition chamber is a well-known means of eliminating contaminants in the chamber. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

With respect to claim 22, the transfer vacuum chamber 1 of Arai reads on a "conveyor chamber."

With respect to claims 44 and 45, it would have been obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which

Art Unit: 1762

the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

With respect to new claim 63, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

**7. Claims 37, 43, 48, 53, and 64 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A) and Grothe et al. (US 3,931,490 A).**

The teaching of Arai is detailed in paragraph 8 above. Arai does not place any limitations on the vapor deposition processes carried-out in the chambers.

Arai does not teach that the first and second evaporation sources have a first direction longer than a second direction or that the relative positions of the sources and the substrates are repeatedly moved during deposition so that a same portion of the substrate is coated with the organic EL material at least twice.

Grothe teaches that, when coating a substrate by vapor deposition, an evaporation source elongated in one dimension results in enhanced vapor density and deposition uniformity over the entire width of the substrate [c. 5, ll. 40 – 50 and 60 – 63]. It is the examiner's position that the source of Grothe reads on applicant's source.

Art Unit: 1762

It would have been obvious to one of ordinary skill in the art to modify the process of Arai so as to utilize, as the evaporation source, the evaporation source of Grothe. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of achieving enhanced vapor density and deposition uniformity, as taught by Grothe.

Bennett teaches that, in a vacuum vapor deposition process, moving the evaporation source with respect to the substrate improves deposition speed and uniformity [c. 3, ll. 1 – 10].

It would have been further obvious to one of ordinary skill in the art to modify the method of Arai so as to move the evaporation source relative to the substrate, as taught by Bennett. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of improving deposition speed and uniformity.

None of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

It would have been further obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

With respect to claim 53, none of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a

Art Unit: 1762

coating step the number of times required to build-up a coating of a desired thickness.

Consequently, it would have been obvious to one of ordinary skill in the art to do so.

With respect to new claim 64, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

**8. Claims 38, 48, 56, and 65 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A), Grothe et al. (US 3,931,490 A), and Monk (US 4,187,801 A).**

The combined teaching of Arai, Bennett, and Grothe is detailed above. None of the references teach that the evaporation sources are longer than at least one edge of the substrate.

Monk teaches that, in a vapor deposition method, it is conventional to treat a larger area than covered by the substrate to avoid edge effects [c. 1, ll. 17 – 20].

Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Bennett, and Grothe, so as to utilize an elongated source that is longer than at least one edge of the substrate. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of avoiding edge effects, as suggested by Monk.

None of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of

Art Unit: 1762

times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

It would have been further obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

With respect to claim 53, none of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

With respect to new claim 65, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

9. **Claim 39, 48, 53, 57, and 66 are rejected under 35 U.S.C. § 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Feuerstein et al. (US 4,627,989 A), Bennett (US 2,435,997 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent).**

Art Unit: 1762

The teaching of Arai is detailed above. Arai does not place any limitations on the vapor deposition processes carried-out in the chambers.

Arai does not teach that first and second evaporation sources comprise a plurality of evaporation cells arranged along a first direction or that the relative positions of the sources are repeatedly moved with respect to the substrate during deposition so that a same portion of the substrate is coated at least twice.

Feuerstein teaches a method of coating a substrate utilizing a vacuum evaporator comprising an elongated array of individually controllable vapor sources [c. 1, ll. 21 - 24; c. 2, ll. 40 - 45; c. 4, ll. 55 - 57; and c. 6, ll. 18 - 26]. Such a source facilitates greater control over deposition thickness and uniformity [c. 2, ll. 41 - 45].

It would have been obvious to one of ordinary skill in the art to modify the process of Arai so as to utilize an evaporation source comprising a plurality of evaporation cells arranged along a first direction so as to achieve greater control over deposition thickness and uniformity, as suggested by Feuerstein.

It would have been further obvious to move the relative position of this source with respect to the substrate during evaporation. Bennett teaches that moving the source with respect to the substrate improves deposition speed and uniformity [see above]. Specifically moving the source instead of the substrate is considered advantageous because it requires a smaller vacuum chamber [c. 3, l. 72 - c. 4, l. 3].

None of the cited references teach coating the same portion of substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of

Art Unit: 1762

times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to do so.

It would have been obvious to one of ordinary skill in the art to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

Lastly, none of the cited references teach applicant's newly-added limitation requiring "cleaning an inside of the evaporation chamber." Yamamoto teaches that, in the vapor deposition of organic thin films for EL devices, it is conventional to clean the parts equipped in each chamber and the inside wall of the chambers after every deposition on the substrate (2:23-27). Doing so prevents contamination of the substrate by residual organic material having a tendency to peel-off of the chamber surfaces (2:63-3:8). Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to perform the conventional step of cleaning the deposition chamber. One of ordinary skill would have been motivated to do so by the desire and expectation of preventing contamination of the substrate.

The examiner notes that the body of Yamamoto's disclosure is directed to a method in which an additional set of cleaned parts is provided in each chamber, thereby eliminating the need to clean after each step, thereby saving time (5:45-8:30). Consequently, in the alternative, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to provide an additional set of cleaned parts to eliminate the need

Art Unit: 1762

for repeated cleaning. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of reducing the processing time. The parts still need to be cleaned at some point, either before, during, or after the deposition process. Consequently, Yamamoto's invention also reads on applicant's claimed "cleaning an inside of the evaporation chamber."

With respect to claim 53, none of the cited references teach coating the same portion of substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to do so.

With respect to new claim 66, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

**10. Claim 40, 48, 58, and 67 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Feuerstein et al. (US 4,627,989 A), Bennett (US 2,435,997 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent) or, in the alternative, over Arai et al., in view of Feuerstein et al., Bennett, Monk (US 4,187,801 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent).**

The combined teaching of Arai, Feuerstein, and Bennett is detailed above. Additionally, Feuerstein illustrates, but does not require, a source that is longer than at least one edge of the

Art Unit: 1762

substrate [Fig. 1]. Nevertheless, it would have been obvious to utilize a source longer than at least one edge of the substrate to avoid edge effects, as taught by Monk [see above].

It would have been further obvious to move the relative position of this source with respect to the substrate during evaporation. Bennett teaches that moving the source with respect to the substrate improves deposition speed and uniformity [see above]. Specifically moving the source instead of the substrate is considered advantageous because it requires a smaller vacuum chamber [c. 3, l. 72 - c. 4, l. 3].

None of the cited references teach coating the same portion of substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to do so.

It would have been obvious to one of ordinary skill in the art to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

Lastly, none of the cited references teach applicant's newly-added limitation requiring "cleaning an inside of the evaporation chamber." Yamamoto teaches that, in the vapor deposition of organic thin films for EL devices, it is conventional to clean the parts equipped in each chamber and the inside wall of the chambers after every deposition on the substrate (2:23-27). Doing so prevents contamination of the substrate by residual organic material having a tendency to peel-off of the chamber surfaces (2:63-3:8). Consequently, it would have been

Art Unit: 1762

obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to perform the conventional step of cleaning the deposition chamber. One of ordinary skill would have been motivated to do so by the desire and expectation of preventing contamination of the substrate.

The examiner notes that the body of Yamamoto's disclosure is directed to a method in which an additional set of cleaned parts is provided in each chamber, thereby eliminating the need to clean after each step, thereby saving time (5:45-8:30). Consequently, in the alternative, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to provide an additional set of cleaned parts to eliminate the need for repeated cleaning. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of reducing the processing time. The parts still need to be cleaned at some point, either before, during, or after the deposition process. Consequently, Yamamoto's invention also reads on applicant's claimed "cleaning an inside of the evaporation chamber."

With respect to new claim 67, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

11. **Claim 49 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Arai et al. (US 5,817,366 A) in view of Grothe et al. (US 3,391,490 A) and Monk (US 4,187,801 A), as applied to claim 20 above, further in view of Spitzer et al. (US 5,258,325 A).**

The teachings of all of the cited references are described above. None of these teach that the display device is an active matrix electroluminescence display device.

Spitzer et al. teach that it is the electrode arrangement that distinguishes an active matrix device. Consequently, it is the examiner's position that it would have been obvious to utilize the above-cited methods of depositing organic electroluminescent material to manufacture an active matrix electroluminescent display device. One of ordinary skill in the art would have been motivated by the expectation of successfully manufacturing an active matrix EL display device since the deposition of the organic EL material does not determine whether or not the matrix is active.

**12. Claims 54 and 68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A), Grothe et al. (US 3,931,490 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent).**

The teaching of Arai is detailed in paragraph 8 above. Arai does not place any limitations on the vapor deposition processes carried-out in the chambers.

Arai does not teach that the first and second evaporation sources have a first direction longer than a second direction or that the relative positions of the sources and the substrates are repeatedly moved during deposition so that a same portion of the substrate is coated with the organic EL material at least twice.

Grothe teaches that, when coating a substrate by vapor deposition, an evaporation source elongated in one dimension results in enhanced vapor density and deposition uniformity over the

Art Unit: 1762

entire width of the substrate [c. 5, ll. 40 – 50 and 60 – 63]. It is the examiner's position that the source of Grothe reads on applicant's source.

It would have been obvious to one of ordinary skill in the art to modify the process of Arai so as to utilize, as the evaporation source, the evaporation source of Grothe. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of achieving enhanced vapor density and deposition uniformity, as taught by Grothe.

Bennett teaches that, in a vacuum vapor deposition process, moving the evaporation source with respect to the substrate improves deposition speed and uniformity [c. 3, ll. 1 – 10].

It would have been further obvious to one of ordinary skill in the art to modify the method of Arai so as to move the evaporation source relative to the substrate, as taught by Bennett. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of improving deposition speed and uniformity.

None of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

It would have been further obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

Lastly, none of the cited references teach applicant's newly-added limitation requiring "cleaning an inside of the evaporation chamber." Yamamoto teaches that, in the vapor deposition of organic thin films for EL devices, it is conventional to clean the parts equipped in each chamber and the inside wall of the chambers after every deposition on the substrate (2:23-27). Doing so prevents contamination of the substrate by residual organic material having a tendency to peel-off of the chamber surfaces (2:63-3:8). Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to perform the conventional step of cleaning the deposition chamber. One of ordinary skill would have been motivated to do so by the desire and expectation of preventing contamination of the substrate.

The examiner notes that the body of Yamamoto's disclosure is directed to a method in which an additional set of cleaned parts is provided in each chamber, thereby eliminating the need to clean after each step, thereby saving time (5:45-8:30). Consequently, in the alternative, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to provide an additional set of cleaned parts to eliminate the need for repeated cleaning. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of reducing the processing time. The parts still need to be cleaned at some point, either before, during, or after the deposition process. Consequently, Yamamoto's invention also reads on applicant's claimed "cleaning an inside of the evaporation chamber."

With respect to new claim 68, it is the examiner's position that the shape and distribution of the film thickness is a physical characteristic inherently arising from shape and arrangement of the evaporation source. Since this combination of references otherwise teaches all of applicant's

Art Unit: 1762

other method limitations — including the shape and arrangement of the evaporation source(s) — it is the examiner's position that the deposited film inherently possesses the characteristics recited in this claim.

13. **Claim 55 is rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A), Grothe et al. (US 3,931,490 A), Monk (US 4,187,801 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent).**

The combined teaching of Arai, Bennett, and Grothe is detailed above. None of the references teach that the evaporation sources are longer than at least one edge of the substrate.

Monk teaches that, in a vapor deposition method, it is conventional to treat a larger area than covered by the substrate to avoid edge effects [c. 1, ll. 17 – 20].

Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Bennett, and Grothe, so as to utilize an elongated source that is longer than at least one edge of the substrate. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of avoiding edge effects, as suggested by Monk.

None of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

It would have been further obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of

Art Unit: 1762

elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source..

The combined teaching of Arai, Bennett, and Grothe is detailed above. None of the references teach that the evaporation sources are longer than at least one edge of the substrate.

Monk teaches that, in a vapor deposition method, it is conventional to treat a larger area than covered by the substrate to avoid edge effects [c. 1, ll. 17 – 20].

Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Bennett, and Grothe, so as to utilize an elongated source that is longer than at least one edge of the substrate. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of avoiding edge effects, as suggested by Monk.

None of the cited references teach coating the same portion of the substrate twice. It is, nevertheless, well-known in the art of coating substrates to repeat a coating step the number of times required to build-up a coating of a desired thickness. Consequently, it would have been obvious to one of ordinary skill in the art to do so.

It would have been further obvious, to one of ordinary skill in the art, to optimize the orientation of the source with respect to the direction of motion so as to achieve the greatest efficiency and uniformity of coating. In particular, an orientation in which the direction of elongation of the source is perpendicular to the direction of motion allows coating the widest swath of substrate possible with each pass of the coating source.

Lastly, none of the cited references teach applicant's newly-added limitation requiring "cleaning an inside of the evaporation chamber." Yamamoto teaches that, in the vapor deposition of organic thin films for EL devices, it is conventional to clean the parts equipped in

Art Unit: 1762

each chamber and the inside wall of the chambers after every deposition on the substrate (2:23-27). Doing so prevents contamination of the substrate by residual organic material having a tendency to peel-off of the chamber surfaces (2:63-3:8). Consequently, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to perform the conventional step of cleaning the deposition chamber. One of ordinary skill would have been motivated to do so by the desire and expectation of preventing contamination of the substrate.

The examiner notes that the body of Yamamoto's disclosure is directed to a method in which an additional set of cleaned parts is provided in each chamber, thereby eliminating the need to clean after each step, thereby saving time (5:45-8:30). Consequently, in the alternative, it would have been obvious to one of ordinary skill in the art to modify the method of Arai, Feuerstein, and Bennett so as to provide an additional set of cleaned parts to eliminate the need for repeated cleaning. One of ordinary skill in the art would have been motivated to do so by the desire and expectation of reducing the processing time. The parts still need to be cleaned at some point, either before, during, or after the deposition process. Consequently, Yamamoto's invention also reads on applicant's claimed "cleaning an inside of the evaporation chamber."

**14. Claim 59 is rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A) and Grothe et al. (US 3,931,490 A), as applied to claim 37 above, further in view of Spitzer et al. (US 5,258,325 A).**

The teachings of all of the cited references are described above. None of these teach that the display device is an active matrix electroluminescence display device.

Art Unit: 1762

Spitzer et al. teach that it is the electrode arrangement that distinguishes an active matrix device. Consequently, it is the examiner's position that it would have been obvious to utilize the above-cited methods of depositing organic electroluminescent material to manufacture an active matrix electroluminescent display device. One of ordinary skill in the art would have been motivated by the expectation of successfully manufacturing an active matrix EL display device since the deposition of the organic EL material does not determine whether or not the matrix is active.

**15. Claim 60 is rejected under 35 U.S.C. 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Bennett (US 2,435,997 A), Grothe et al. (US 3,931,490 A), and Monk (US 4,187,801 A), as applied to claim 38 above, further in view of Spitzer et al. (US 5,258,325 A).**

The teachings of all of the cited references are described above. None of these teach that the display device is an active matrix electroluminescence display device.

Spitzer et al. teach that it is the electrode arrangement that distinguishes an active matrix device. Consequently, it is the examiner's position that it would have been obvious to utilize the above-cited methods of depositing organic electroluminescent material to manufacture an active matrix electroluminescent display device. One of ordinary skill in the art would have been motivated by the expectation of successfully manufacturing an active matrix EL display device since the deposition of the organic EL material does not determine whether or not the matrix is active.

16. **Claim 61 rejected under 35 U.S.C. § 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Feuerstein et al. (US 4,627,989 A), Bennett (US 2,435,997 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent), as applied to claim 39 above, further in view of Spitzer et al. (US 5,258,325 A).**

The teachings of all of the cited references are described above. None of these teach that the display device is an active matrix electroluminescence display device.

Spitzer et al. teach that it is the electrode arrangement that distinguishes an active matrix device. Consequently, it is the examiner's position that it would have been obvious to utilize the above-cited methods of depositing organic electroluminescent material to manufacture an active matrix electroluminescent display device. One of ordinary skill in the art would have been motivated by the expectation of successfully manufacturing an active matrix EL display device since the deposition of the organic EL material does not determine whether or not the matrix is active.

17. **Claim 62 is rejected under 35 U.S.C. § 103(a) as being unpatentable over Arai et al. (US 5,817,366 A), in view of Feuerstein et al. (US 4,627,989 A), Bennett (US 2,435,997 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent) or, in the alternative, over Arai et al., in view of Feuerstein et al., Bennett, Monk (US 4,187,801 A), and Yamamoto et al. (JP 11-61386 A, US 6,179,923 B1 provided as English-language equivalent), as applied to claim 40 above, further in view of Spitzer et al. (US 5,258,325 A).**

The teachings of all of the cited references are described above. None of these teach that the display device is an active matrix electroluminescence display device.

Art Unit: 1762
